GTM_ATOM_PWM_1 for KIT_AURIX_TC275_LK

GTM ATOM PWM generation

AURIX™ TC2xx Microcontroller Training
V1.0.0

Scope of work

GTM ATOM is used to generate a PWM signal, which is driving the intensity of an LED.

The LED is driven by pin 5 of the port 00. The state of the pin is controlled by the PWM signal generated by the ATOM timer of GTM.

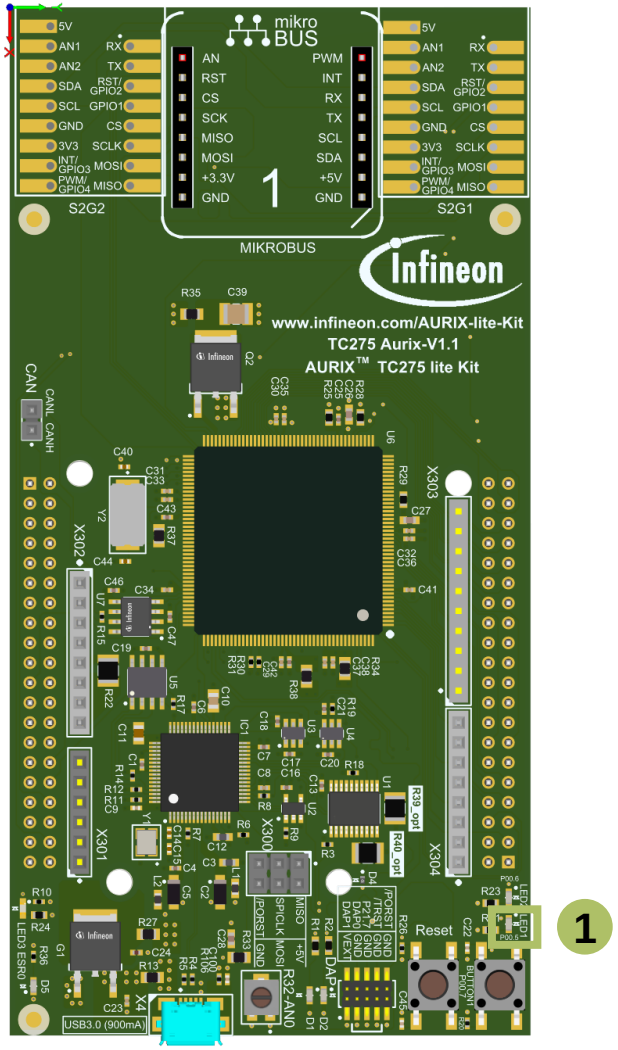
Introduction

- The Generic Timer Module (GTM) is a modular timer unit designed to accommodate many timer applications
- It has an in-built Advanced Router Unit (ARU) that can be used to exchange specific data between sub-modules without CPU interaction
- The ARU-connected Timer Output Module (ATOM), which is part of the GTM, is able to generate complex output signals
- The Clock Management Unit (CMU) is responsible for clock generation of the GTM. The Configurable Clock Generation Subunit (CFGU) provides eight clock sources for the GTM submodules: TIM, TBU, MON and ATOM

Hardware setup

This code example has been developed for the board KIT_AURIX_TC275_LITE.

LED1 (1) is used for this example.



Implementation

Configuring the ATOM

The configuration of the ATOM is done once in the setup phase by calling the initialization function ***initGtmAtomPwm()*** containing the following steps:

- Enable the GTM by calling the function ***IfxGtm_enable()***
- Set the CMU clock 0 frequency to 1 MHz with the function ***IfxGtm_Cmu_SetClkFrequency()***
- Enable the CMU clock 0 by calling the function ***IfxGtm_Cmu_enableClocks()***

The function ***IfxGtm_Atom_Pwm_initConfig()*** initializes an instance of the structure ***IfxGtm_Atom_Pwm_Config*** with its default values.

Implementation

Configuring the ATOM

- The ***IfxGtm_Atom_Pwm_Config*** structure allows to set the following parameters to initialize the module:
  - ***atom*** – Selection of the ATOM which is counting (ATOM 1 in this example)
  - ***atomChannel*** – Selection of the channel which is driving the LED (Channel 4 in this example)
  - ***period*** – Setting of the period for the PWM signal to the desired value
  - ***pin.outputPin*** – Selection the LED as output pin
  - ***synchronousUpdateEnable*** – Enabling of Synchronous Update of the timer

- After configuration, the function ***IfxGtm_Atom_Pwm_init()*** initializes and activates the ATOM with the user configuration

- Start the PWM with the function ***IfxGtm_Atom_Pwm_start()***

All the functions used for the configuration of the ATOM are provided by the iLLD header ***IfxGtm_Atom_Pwm.h***.

Implementation

Setting the duty cycle

The setting of the duty cycle is done by calling the function ***setDutyCycle()***, which contains the following steps:

- Set the ***dutyCycle*** parameters of the instance of the configuration structure to set the duty cycle for the PWM signal to the desired value
- Call the function ***IfxGtm_Atom_Pwm_init()*** to re-initialize and re-activates the ATOM with the new configuration

The functions ***IfxGtm_Atom_Pwm_init()*** is provided by the iLLD header ***IfxGtm_Atom_Pwm.h***.

Fading the LED

The fading of the LED is done in the function ***fadeLED()*** by repetitively adding or removing a step value to the duty cycle of the PWM.

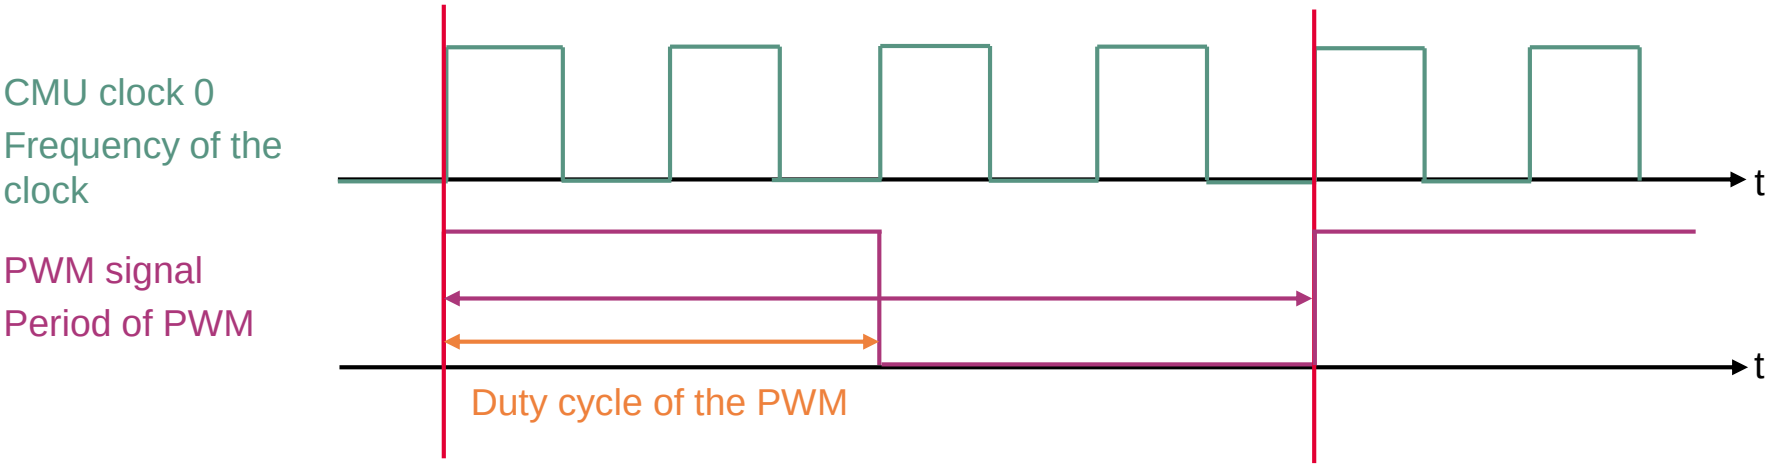
Implementation

Calculation example

The CMU clock 0 frequency (f_{clk0}) is set to 1 MHz in this example. The period value to have the desired PWM frequency (f_{PWM}) is calculated with the following formula:

$$Period = \frac{f_{clk0}}{f_{PWM}}$$

In this example: $Period = \frac{1\ MHz}{200\ Hz} = 5\ 000$



Run and Test

After code compilation and flashing the device, observe the **LED1**, which should be fading.
